

CS 316 (Kong): TinyJ Assignment 1

To be submitted **no later than**: Tuesday, May 3. [Note: I expect euclid to be up until midnight that evening, but there is no guarantee that it will be: If euclid unexpectedly goes down after 6 p.m., the deadline will **not** be extended. If you try to submit after 6 p.m. that evening and find that euclid is down, you may have to make a **late** submission! Try to submit no later than noon that day, and **on an earlier day if possible**.] This assignment counts **1.5%** towards your grade if the grade is computed using rule A.

The TinyJ language is an extremely small subset of Java. Every valid TinyJ program is a valid Java program, and has the same semantics whether it is regarded as a TinyJ or a Java program. The syntax of TinyJ is given by the EBNF specification that is shown below. *In this EBNF specification each terminal is a token of TinyJ, and each nonterminal $\langle X \rangle$ denotes the set of all sequences of tokens that are **syntactically valid** for the TinyJ construct X .* In particular, a piece of source code is a *syntactically valid* TinyJ program if and only if its sequence of tokens belongs to the language generated by this EBNF specification. A piece of source code is a valid TinyJ program if and only if it is *both* a syntactically valid TinyJ program *and* a valid Java 8 program, with a few exceptions: TinyJ does **not** allow non-decimal (i.e., hexadecimal, octal, or binary) or long integer literals, underscores in integer literals, method name overloading, program arguments, printing of Boolean values, “return;” statements within the **main()** method, escape sequences other than `\n`, `\\`, and `\"`, and ints that are $\geq 2^{31} - 2^{16} = 2,147,418,112$.

Reserved words of TinyJ are shown in boldface in this EBNF specification. Some names used by Java library packages, classes, and their methods (e.g., **java**, **Scanner**, and **nextInt**) are reserved words of TinyJ, as is **main**. Otherwise, IDENTIFIER here means any Java identifier consisting of ASCII characters.

→ indicates a nonterminal whose method you must complete in Parser.java--other methods have already been written for you!

```
<program> ::= [<importStmt>] class IDENTIFIER '{' {<dataFieldDecl>}
               <mainDecl> {<methodDecl>} '}'

<importStmt> ::= import java . util . Scanner ;
<dataFieldDecl> ::= static <varDecl>
<varDecl> ::= int <singleVarDecl> { , <singleVarDecl> } ;
               | Scanner IDENTIFIER = new Scanner '(' System . in ')' ;
→ <singleVarDecl> ::= IDENTIFIER { '[' ']' } [ = <expr3> ]
<mainDecl> ::= public static void main '(' String IDENTIFIER '[' ']' ')'
               <compoundStmt>
→ <methodDecl> ::= static ( void | int { '[' ']' } ) IDENTIFIER
               '(' <parameterDeclList> ')' <compoundStmt>
<parameterDeclList> ::= [<parameterDecl> { , <parameterDecl> } ]
<parameterDecl> ::= int IDENTIFIER { '[' ']' }
→ <compoundStmt> ::= '{' { <statement> } '}'
<statement> ::= ; | return [<expr3>] ; | <varDecl> | <assignmentOrInvoc>
               | <compoundStmt> | <ifStmt> | <whileStmt> | <outputStmt>
→ <assignmentOrInvoc> ::= IDENTIFIER ( { '[' <expr3> ']' } = <expr3> ; | <argumentList> ; )
→ <argumentList> ::= '(' [<expr3> { , <expr3> } ] ')'
→ <ifStmt> ::= if '(' <expr7> ')' <statement> [else <statement>]
→ <whileStmt> ::= while '(' <expr7> ')' <statement>
→ <outputStmt> ::= System . out . ( print '(' <printArgument> ')' ;
               | println '(' [<printArgument> ] ')' ;
               )
→ <printArgument> ::= CHARSTRING | <expr3>
→ <expr7> ::= <expr6> { '|' <expr6> }
→ <expr6> ::= <expr5> { & <expr5> }
→ <expr5> ::= <expr4> { (== | !=) <expr4> }
→ <expr4> ::= <expr3> [ (> | < | >= | <=) <expr3> ]
→ <expr3> ::= <expr2> { (+ | -) <expr2> }
→ <expr2> ::= <expr1> { (* | / | %) <expr1> }
→ <expr1> ::= '(' <expr7> ')' | (+ | - | !) <expr1> | UNSIGNEDINT | null
               | new int '[' <expr3> ']' { '[' ']' }
               | IDENTIFIER ( . nextInt '(' ')' | [<argumentList> ] { '[' <expr3> ']' } )
```

This is the first of three TinyJ assignments. After completing all three assignments you will have a program that can compile any TinyJ program into a simple virtual machine code, and then execute the virtual machine code it has generated. (Execution should produce the same run-time behavior as you would get if you compiled the same TinyJ program using `javac` into a `.class` file and then executed that `.class` file using a Java VM.) **There will be exam questions relating to the TinyJ assignments.**

TinyJ Assignment 1 will not deal with compilation of TinyJ programs, nor with execution of virtual machine code, but only with *syntax analysis* of TinyJ programs. The goal of TinyJ Assignment 1 is to complete a program that will:

- (a) determine if the sequence of tokens of its input file belongs to $\langle \text{program} \rangle$ (as defined by the above EBNF rules), and
- (b) output a parse tree of the sequence of tokens of its input file, if that sequence belongs to $\langle \text{program} \rangle$.

Regarding (a), note that the sequence of tokens of the input file belongs to $\langle \text{program} \rangle$ if, and only if, the input file is a *syntactically valid* TinyJ program. However, a syntactically valid TinyJ program may still contain errors like “undeclared variable” or “array index out of range”. A “sideways” representation of ordered trees, described below, will be used for (b).

A Sideways Representation of an Ordered Rooted Tree T

If T has just one node, then
Otherwise,

representation of T = the unique node of T
representation of T = the root of T

representation of the 1st subtree of the root of T
representation of the 2nd subtree of the root of T
...
representation of the last subtree of the root of T
... node has no more children

In this sideways representation, sibling nodes always have the *same* indentation, but each non-root node is further indented than its parent; *the indentation of a node is proportional to the depth of that node in the tree*. Here are the “ordinary” and the “sideways” representations of a tree:

```

      <expr4>
      |
      <expr3>
      / | \
    <expr2> + <expr2>
      / | \ / | \
    <expr1> <expr1> * <expr1>
      |           |           |
    UNSIGNEDINT IDENTIFIER UNSIGNEDINT
  
```

```

<expr4>
<expr3>
<expr2>
<expr1>
  UNSIGNEDINT
  ... node has no more children
  ... node has no more children
+
<expr2>
<expr1>
  IDENTIFIER
  ... node has no more children
*
<expr1>
  UNSIGNEDINT
  ... node has no more children
  ... node has no more children
  ... node has no more children
  ... node has no more children
  
```

Indentation level

= **depth of node** in the tree

Indentation levels of consecutive lines are equal or differ by just 1:

If previous line is a *nonterminal*, then the current line's indentation level is **higher by 1**.

If previous line is a *token/terminal*, then the current line's indentation level is **the same**.

If previous line is ... node has no more children, the current line's indentation level is **lower by 1**.

How to Install the TinyJ Assignment 1 Files on euclid, venus, and (optionally) Your PC

Do 1 – 5, and optionally 6 – 11, before our class on **Wednesday, April 13**. (See “Seven Files We May Refer to in Class ...” on p. 3.) Remember that Unix/Linux file and command names are case-sensitive when following the instructions below!

1. Login to euclid and enter: `/users/kong300/316/TJ1setup` [The 1 in TJ1setup is the digit 1, not the letter l.]
2. Wait for the line “TJ1setup done” to appear on the screen, and then enter the following command on *euclid*:
`java -cp TJ1solclasses:. TJ1asn.TJ CS316ex12.java 12.sol`
 Note the period after the *colon* in this command. This command executes my solution to this assignment with CS316ex12.java as the input file and 12.sol as the output file. A listing of CS316ex12.java should be displayed on the screen, and 12.sol should contain a sideways representation of the program's parse tree afterwards. **There should not be any error message**. To view the tree, you can use `less 12.sol` or just open 12.sol in an editor.
3. Logout from euclid and login to venus.
4. Enter the following on venus: `/home/faculty/ykong/TJ1setup`
 [Again, the 1 in TJ1setup is the digit 1, not the letter l.]
5. Repeat step 2 above on venus.

The following 6 steps are needed **only if** you are interested in doing TinyJ assignments on your PC rather than euclid or venus. (Regardless of where you do your work, you must submit on *euclid*.) These steps assume your PC is connected to the Internet.

A Correct TinyJ Input File and the Corresponding Parse Tree That is Written to the Output File by a Solution to TinyJ Assignment 1

Input File (a TinyJ program):

```
import java.util.Scanner;

class Simple2 {

    static Scanner input = new Scanner(System.in);

    public static void main(String args[])
    {
        int x = input.nextInt();
        x = x % 3;
        System.out.println(x + 2);
    }
}
```

Output File (the above program's parse tree, in sideways representation):

```
<program>
<importStmt>
  Reserved Word: import
  Reserved Word: java
  .
  Reserved Word: util
  .
  Reserved Word: Scanner
  ;
  ... node has no more children
Reserved Word: class
IDENTIFIER: Simple2
{
<dataFieldDecl>
  Reserved Word: static
<varDecl>
  Reserved Word: Scanner
  IDENTIFIER: input
  =
  Reserved Word: new
  Reserved Word: Scanner
  (
  Reserved Word: System
  .
  Reserved Word: in
  )
  ;
  ... node has no more children
  ... node has no more children
<mainDecl>
  Reserved Word: public
  Reserved Word: static
  Reserved Word: void
  Reserved Word: main
  (
  Reserved Word: String
  IDENTIFIER: args
  [
  ]
  )
<compoundStmt>
{
  <statement>
  <varDecl>
    Reserved Word: int
```

```
<singleVarDecl>
  IDENTIFIER: x
  =
  <expr3>
    <expr2>
      <expr1>
        IDENTIFIER: input
        .
        Reserved Word: nextInt
        (
        )
        ... node has no more children
        ... node has no more children
        ... node has no more children
        ... node has no more children
      ;
      ... node has no more children
      ... node has no more children
    <statement>
    <assignmentOrInvoc>
      IDENTIFIER: x
      =
      <expr3>
        <expr2>
          <expr1>
            IDENTIFIER: x
            ... node has no more children
          %
          <expr1>
            UNSIGNED INTEGER LITERAL: 3
            ... node has no more children
            ... node has no more children
            ... node has no more children
          ;
          ... node has no more children
          ... node has no more children
        <statement>
        <outputStmt>
          Reserved Word: System
          .
          Reserved Word: out
          .
          Reserved Word: println
          (
          <printArgument>
          <expr3>
            <expr2>
              <expr1>
                IDENTIFIER: x
                ... node has no more children
                ... node has no more children
              +
              <expr2>
                <expr1>
                  UNSIGNED INTEGER LITERAL: 2
                  ... node has no more children
                  ... node has no more children
                  ... node has no more children
                  ... node has no more children
                )
              ;
              ... node has no more children
              ... node has no more children
            }
            ... node has no more children
            ... node has no more children
          }
          ... node has no more children
```

A TinyJ Input File with a Syntax Error, and the Output That is Generated by a Solution to TinyJ Assignment 1

Input File (the error is that `public` should be preceded by a semicolon):

```
import java.util.Scanner;

class Simple2 {

    static Scanner input = new Scanner(System.in)

    public static void main(String args[])
    {
        int x = input.nextInt();
        x = x % 3;
        System.out.println(x + 2);
    }
}
```

Wrong token: Symbols.SEMICOLON expected, not Symbols.PUBLIC

Output on the Screen (shows the tokens that are read before the error is detected):

```
1:  import java.util.Scanner;
2:
3:  class Simple2 {
4:
5:      static Scanner input = new Scanner(System.in)
6:
7:      public
```

```
ERROR!  Something's wrong--maybe the following token is missing: ;
input.currentChar = ' '
LexicalAnalyzer.currentToken = Reserved Word: public
```

Output File (an incomplete parse tree whose leaves are the tokens that appear in the input file before the syntax error):

```
<program>
<importStmt>
  Reserved Word: import
  Reserved Word: java
  .
  Reserved Word: util
  .
  Reserved Word: Scanner
  ;
  ... node has no more children
Reserved Word: class
IDENTIFIER: Simple2
{
<dataFieldDecl>
  Reserved Word: static
<varDecl>
  Reserved Word: Scanner
  IDENTIFIER: input
  =
  Reserved Word: new
  Reserved Word: Scanner
  (
  Reserved Word: System
  .
  Reserved Word: in
  )
```

Last correct token: Symbols.RPAREN

```

1  package Tjlexer;
2
3  import java.util.EnumSet;
4
5  public enum Symbols {
6
7      // TinyJ reserved words
8      INT("Reserved Word: int", "int"),
9      VOID("Reserved Word: void", "void"),
10     STATIC("Reserved Word: static", "static"),
11     IF("Reserved Word: if", "if"),
12     WHILE("Reserved Word: while", "while"),
13     ELSE("Reserved Word: else", "else"),
14     NEW("Reserved Word: new", "new"),
15     OUT("Reserved Word: out", "out"),
16     PRINT("Reserved Word: print", "print"),
17     SYSTEM("Reserved Word: System", "System"),
18     PRINTLN("Reserved Word: println", "println"),
19     RETURN("Reserved Word: return", "return"),
20     IN("Reserved Word: in", "in"),
21     NULL("Reserved Word: null", "null"),
22     NEXTINT("Reserved Word: nextInt", "nextInt"),
23     MAIN("Reserved Word: main", "main"),
24     JAVA("Reserved Word: java", "java"),
25     UTIL("Reserved Word: util", "util"),
26     CLASS("Reserved Word: class", "class"),
27     STRING("Reserved Word: String", "String"),
28     PUBLIC("Reserved Word: public", "public"),
29     IMPORT("Reserved Word: import", "import"),
30     SCANNER("Reserved Word: Scanner", "Scanner"),
31     // End of TinyJ reserved words. (See the definition of the reservedWords EnumSet below.)
32
33     // Other TinyJ tokens that have just one instance
34     LBRACE("{"),
35     RBRACE("}"),
36     COMMA(","),
37     SEMICOLON(";"),
38     BECOMES("="),
39     LPAREN("("),
40     RPAREN(")"),
41     LBRACKET("["),
42     RBRACKET("]"),
43     DOT("."),
44     OR("|"),
45     AND("&"),
46     NOT("!"),
47     EQ("=="),

```

There is one **Symbols.X** enum constant object for each token and each nonterminal of the EBNF specification of TinyJ:

For each *token*, the name **X** will be **all uppercase**. **Examples:**

Symbols.WHILE (line 12) Symbols.BECOMES (line 38)
 Symbols.EQ (line 47) Symbols.IDENT (line 60)

For each *nonterminal*, the name **X** will be **NT followed by the name of the nonterminal**. **Examples:**

Symbols.NTprogram (line 72) Symbols.NTwhileStmt (line 86)

For each **Symbols.X** enum constant object, the field
X.symbolRepresentationForOutputFile (see line 100)
 is set to the string passed as *1st argument of the constructor call* for **Symbols.X**---see line 106.

A call of TJ.output.printSymbol(Symbols.X)
 or a call of TJ.output.printSymbol(Symbols.X, null)
 will print the string **X.symbolRepresentationForOutputFile**
 to the *output file* as a node of the sideways parse tree (*with the correct indentation*), unless X is NONE.

```
48     NE("!="),
49     GT(">"),
50     LT("<"),
51     GE(">="),
52     LE("<="),
53     TIMES("*"),
54     DIV("/"),
55     MOD("%"),
56     PLUS("+"),
57     MINUS("-"),
58
59     // TinyJ tokens that have more than one instance
60     IDENT("IDENTIFIER"),

112 }
```

A Correct TinyJ Input File and the Corresponding Parse Tree That is Written to the Output File by a Solution to TinyJ Assignment 1

Input File (a TinyJ program):

```
import java.util.Scanner;

class Simple2 {

    static Scanner input = new Scanner(System.in);

    public static void main(String args[])
    {
        int x = input.nextInt();
        x = x % 3;
        System.out.println(x + 2);
    }
}
```

```
<singleVarDecl>
  IDENTIFIER: x
  =
  <expr3>
    <expr2>
      <expr1>
        IDENTIFIER: input
        .
        Reserved Word: nextInt
        (
        )
        ... node has no more children
        ... node has no more children
        ... node has no more children
        ... node has no more children
        ;
        ... node has no more children
        ... node has no more children
```

Output File (the above program's parse tree, in sideways representation):

Each line of the output file / parse tree is printed by 1 call of TJ.output.printSymbol(...) or by 1 call of TJ.output.decTreeDepth().

```
treeDepth = 0 <program> ← printed by TJ.output.printSymbol(Symbols.NTprogram)

            ... node has no more children
            }
            ... node has no more children
            ... node has no more children
            }
            ... node has no more children
```

6. In a **cmd.exe** (command prompt) window* on your PC, enter the following: **md c:\316java**

*You can open a **cmd.exe** window on your Windows PC as follows:

1. Type **Win-r** (i.e., hold down the Windows-logo key and type **r**) to open the Run dialog box. 2. Type **cmd** into the Open: textbox and press .

7. Enter **javac -version** in the **cmd.exe** window. If you get an error message, or if the version number that is printed is older than **1.8.0**, then download and install a new version of the Java JDK—e.g., the Java SE Development Kit 18—from <https://www.oracle.com/technetwork/java/javase/downloads/index.html> and set the System PATH environment variable to include the directory that contains the compiler **javac.exe** and the program **jar.exe** that are part of the JDK you installed: For a typical installation of the Java SE Development Kit 18, **c:\program files\java\jdk-18\bin** is likely to be the directory that should be included in your System PATH. If you don't know how to add a directory to your System PATH then see, e.g., <https://www.computerhope.com/issues/ch000549.htm> for instructions.[†]

[†]If you have difficulty with steps 1 – 3 of these instructions, try the following instead of those steps:

1. Type **Win-r** (i.e., hold down the Windows-logo key and type **r**) to open the Run dialog box.

2. Type **sysdm.cpl**, 3 into the Open: textbox and press .

Note: If the System PATH already includes a directory for a *previous* Java installation, then move the *new* directory up until it appears *before* all such directories: This is so you will use the *new* versions of **javac.exe** and **java.exe** by default.

8. Make **c:\316java** your working directory by entering the following in the **cmd.exe** window: **cd /d c:\316java**

9. Use an scp or sftp client to download **TJ1asn.jar** from your home directory on *venus* or *euclid* into the **c:\316java** folder on your PC. For example, if **c:\316java** is your working directory in the **cmd.exe** window (see step 8), you can download **TJ1asn.jar** by entering the following in the **cmd.exe** window:

```
scp xxxxx316@euclid.cs.gc.cuny.edu:TJ1asn.jar .
```

Here **xxxxx316** means your *euclid* username. *Note the space followed by a period at the end of this command!*

10. Enter the following *two* commands in the **cmd.exe** window: **jar xvf TJ1asn.jar**
javac -cp . TJ1asn\TJ.java

11. Enter the following command in the **cmd.exe** window:

```
java -cp "TJ1solclasses;." TJ1asn.TJ CS316ex12.java 12.sol
```

The comments on step 2 also apply here, except that a *semicolon* rather than a colon precedes the period and you can use **more 12.sol** (instead of **less 12.sol**) to view the tree. If you are unfamiliar with the **more** command, see, e.g.:

<https://docs.microsoft.com/en-us/windows-server/administration/windows-commands/more>

Seven Files We May Refer to in Class Starting on Wednesday, April 13

From your **TJ1asn** directory on *euclid*:

OutputFileHandler.java.txt **Parser.java.txt** **SourceFileErrorException.java.txt** **TJ.java.txt**

From your **TJ1lexer** directory on *euclid* (the **l** in **TJ1lexer** is the *letter* **l**, not the digit **1**):

LexicalAnalyzer.java.txt **SourceHandler.java.txt** **Symbols.java.txt**

These are the source files of the program, with **line numbers added**. The actual source files (without line numbers) are in the same directories and have the same names, but their extension is **.java**. *If you have done steps 6 – 11 above, you can find the same files in **C:\316java\TJ1asn** and **C:\316java\TJ1lexer** on your PC, and these files can be opened using, e.g., any of the editors recommended in the last paragraph of p. 4 of the *Lisp Assignment 2* document. Otherwise, you can e-mail the files to yourself—e.g., you can send **TJ1asn/TJ.java.txt** to yourself by entering the following on *euclid*:*
pine -attach TJ1asn/TJ.java.txt your-email-address [After *pine* starts up, enter  **y** to send the file.]

How to Execute My Solution to This Assignment

Steps 1 and 4 put 16 files named **CS316exk.java** ($k = 0 - 15$) into your home directories on *euclid* and *venus*. These are all valid TinyJ source files. If you did step 10, it will have put copies of the same 16 files on your PC. You should be able to execute my solution to this assignment either on *euclid* or on *venus* by entering the following command:

```
java -cp TJ1solclasses:. TJ1asn.TJ TinyJ-source-file-name output-file-name
```

[Your current working directory has to be your home directory for this to work.] **args[0]** lld also work in a **args[1]** window on your PC if you have done steps 6 – 11, except that you need a semicolon instead of a colon after **TJ1solclasses** on a PC:

EXAMPLES:

```
java -cp TJ1solclasses:. TJ1asn.TJ CS316ex12.java 12.sol (on euclid or venus)
java -cp "TJ1solclasses;." TJ1asn.TJ CS316ex12.java 12.sol (on a PC)
```

How to Do TinyJ Assignment 1

The file `TJ1asn/Parser.java` is incomplete. It was produced by taking a complete version of that file and replacing parts of the code with comments of the following two forms:

```
/* ???????? */           or (in two places)  /* ????????
                                     */
                                     default: throw ...
```

To complete this assignment, replace every such comment in `TJ1asn/Parser.java` with appropriate code, and recompile the file. On *venus* or *euclid*, you can use any text editor to edit the file. If you are working on your PC, do not use Notepad as your editor; I suggest you use one of the editors listed in the last paragraph on p. 4 of the Lisp Assignment 2 document. (For the second type of comment, the appropriate code should include the `default: throw ...` statement.)

Do **not** put `Parser.java` or `Parser.class` into any directory other than `TJ1asn`. Do **not** change or move other `.java` and `.class` files.

To recompile `TJ1asn/Parser.java` after editing it, enter the following command:

```
javac -cp . TJ1asn/Parser.java
```

IMPORTANT: If you are doing this on *venus* or *euclid*, your current working directory has to be your home directory. If you are doing this on your PC (in a `cmd.exe` window), your working directory has to be `c:\316java` (see installation step 8); otherwise `javac` will not be able to find other classes that are used in `Parser.java`!

As stated on p. 3 of the first-day announcements, keep a backup copy of your edited version of `Parser.java` on *venus* and another backup copy on a different machine.

How to Test Your Solution

To test your completed version of `Parser.java`, first recompile it using `javac -cp . TJ1asn/Parser.java` and then execute `TJ1asn.TJ` with each of the 16 files `CS316exk.java` ($k = 0 - 15$) as the TinyJ source file and `k.out` as the output file, as follows: `java -cp . TJ1asn.TJ CS316exk.java k.out`

If you are doing this on *venus* or *euclid*, your current working directory has to be your home directory. If you are doing this on your PC (in a `cmd.exe` window), your working directory has to be `c:\316java` (see installation step 8).

If your program is correct then in each case the output file `k.out` should be identical to the output file `k.sol` that is produced by running my solution with the same source file as follows:

```
java -cp TJ1solclasses:. TJ1asn.TJ CS316exk.java k.sol      [on euclid or venus]
java -cp "TJ1solclasses;." TJ1asn.TJ CS316exk.java k.sol    [on a PC]
```

On *euclid* and *venus*, use `diff -c` to compare the output files produced by your and my solutions. (This outputs a report of the differences, if any, between the two files.) On a PC, use `fc.exe /n` to compare files. For example, the commands `diff -c k.sol k.out > k.dif` [on *venus* or *euclid*] and `fc.exe /n k.sol k.out > k.dif` [on a PC] output to `k.dif` the differences between `k.sol` and `k.out`. (If your solution is correct, there should be no differences.)

How to Submit a Solution to This Assignment

This assignment is to be submitted *no later than* the due date stated on p. 1. [Note: If *euclid* unexpectedly goes down after 6 p.m. on this due date, the deadline will **not** be extended. Try to submit no later than noon that day, and on an earlier day if possible.] To submit:

1. Add a comment at the beginning of your completed version of `Parser.java` that gives your name and the names of the students you worked with (if any). As usual, you may work with up to two other students, but see the remarks about this on p. 3 of the first-day announcements document.
2. Leave your final version of `Parser.java` on *euclid* in your `TJ1asn` directory, so it replaces the original version of `Parser.java`, before midnight on the due date. When two or three students work together, each of the students must leave his/her completed file in his/her directory. If you are working on *venus* or your PC, you can transfer `Parser.java` to your `TJ1asn` directory on *euclid* by following the instructions on the next page.
3. Be sure to test your submission on euclid. Note that if your modified version of `Parser.java` cannot even be compiled without error on *euclid*, then you will receive no credit at all for your submission!

IMPORTANT: Do NOT open your submitted file `Parser.java` in an editor on *euclid* after the due date, unless you are resubmitting a corrected version of your solution as a *late* submission. Also do not execute `mv`, `chmod`, or `touch` with your submitted file as an argument after the due date. (However, it is OK to view a submitted file using the `less` file viewer after the due date.) Remember that, as stated on page 3 of the first-day announcements document, you are required to keep a backup copy of your submitted file on *venus*, and another copy elsewhere.

3 examples of ???????? comments in Parser.java
that you need to replace with appropriate code.

Parser.java.txt

```
283
284 private static void outputStmt() throws SourceFileErrorException
285 {
286     TJ.output.printSymbol (NToutputStmt);
287     TJ.output.incTreeDepth();
288

46         } finally {
47             if (output != null)

```

the "TJ.output" in TJ.output.printSymbol(...) etc.

The most important line: This tries to read a <program> from the input file and output the parse tree of that <program>.

Error messages are printed to the screen by this exception handler.

A TinyJ Input File with a Syntax Error, and the Output That is Generated by a Solution to TinyJ Assignment 1

Input File (the error is that `public` should be preceded by a semicolon):

```
import java.util.Scanner;

class Simple2 {

    static Scanner input = new Scanner(System.in)

    public static void main(String args[])
    {
        int x = input.nextInt();
        x = x % 3;
        System.out.println(x + 2);
    }
}
```

Output on the Screen (shows the tokens that are read before the error is detected):

```
1:  import java.util.Scanner;
2:
3:  class Simple2 {
4:
5:      static Scanner input = new Scanner(System.in)
6:
7:      public
```

```

A Correct TinyJ Input File and the Corresponding Parse Tree That is Written to the Output File by a Solution to TinyJ Assignment 1

Input File (a TinyJ program):

```
import java.util.Scanner;

class Simple2 {

    static Scanner input = new Scanner(System.in);

    public static void main(String args[])
    {
        int x = input.nextInt();
        x = x % 3;
        System.out.println(x + 2);
    }
}
```

```
<singleVarDecl>
  IDENTIFIER: x
  =
  <expr3>
    <expr2>
      <expr1>
        IDENTIFIER: input
        .
        Reserved Word: nextInt
        (
          )
          ... node has no more children
          ... node has no more children
          ... node has no more children
          ... node has no more children
        ;
        ... node has no more children
        ... node has no more children
```

Output File (the above program's parse tree, in sideways representation):

Each line of the output file / parse tree is printed by 1 call of TJ.output.printSymbol(...) or by 1 call of TJ.output.decTreeDepth().

```
treeDepth = 0 <program> ← printed by TJ.output.printSymbol(Symbols.NTprogram)

91         } while (Character.isLetterOrDigit((char) input.getCurrentChar())
92             || input.getCurrentChar() == '_'
93             || input.getCurrentChar() == '$');
94
```

A successful call of **nextToken()** does the following:

1. Prints **currentToken** to the *output file*.
2. Skips white space, then reads the characters of the next token from the input file and **sets currentToken to the Symbols.X constant which represents that token**.
3. Sets tokenValue appropriately if that token is an *identifier, string literal, or unsigned int literal* token; otherwise tokenValue will be null (from line 81).

```
95     currentSpelling = currentTokenString.toString();
96
97     for (Symbols resWord : Symbols.reservedWords) {
98         if (currentSpelling.equals(resWord.reservedWordSpelling)) {

247
248 }
249
250
251
```

Examples of the Effects of Calls of nextToken():

Suppose the program is at the token instance `apple` in the following assignment statement: **`apple = 25;`**

Then **`currentToken == Symbols.IDENT`** and **`tokenValue == "apple"`**.

The next call of **`nextToken()`** will:

Call **`output.printSymbol(Symbols.IDENT, "apple")`**. This prints `IDENTIFIER: apple` to the output file (with an indentation of `treeDepth`).

Set **`currentToken`** to **`Symbols.BECOMES`**.

Set **`tokenValue`** to **`null`**.

The next call of **`nextToken()`** will:

Call **`output.printSymbol(Symbols.BECOMES, null)`**. This prints `=` to the output file (with an indentation of `treeDepth`).

Set **`currentToken`** to **`Symbols.UNSIGNEDINT`**.

Set **`tokenValue`** to **`25`**.

The next call of **`nextToken()`** will:

Call **`output.printSymbol(Symbols.UNSIGNEDINT, 25)`**. This prints `UNSIGNED INTEGER LITERAL: 25` (with indentation of `treeDepth`).

Set **`currentToken`** to **`Symbols.SEMICOLON`**.

Set **`tokenValue`** to **`null`**.

```

1  package TJlasm;
2
3  import static TJlexer.LexicalAnalyzer.getCurrentToken; allows LexicalAnalyzer.getCurrentToken() to be written as just getCurrentToken().
4  import static TJlexer.LexicalAnalyzer.nextToken; allows LexicalAnalyzer.nextToken() to be written as just nextToken().
5  import static TJlexer.Symbols.*; allows Symbols.SEMICOLON to be written as just SEMICOLON, etc.
6  import TJlexer.Symbols;

44
45     private static void importStmt() throws SourceFileErrorException

```

A call of **accept(X)** does the following:

1. It checks that **currentToken == Symbols.X**.
2. Assuming **currentToken == Symbols.X** it calls **nextToken()**, which:
 - (a) Prints token **Symbols.X** to the output file.
 - (b) Reads in the next token from the input file and sets **currentToken** (& **tokenValue**) accordingly.

But if **currentToken != Symbols.X** when **accept(X)** is called, an exception is thrown and the program will terminate after printing an error message on the screen!

Calling **accept(X)** has the same effect as calling **nextToken()** unless **currentToken != Symbols.X**, in which case the program terminates with an error message.

RECURSIVE DESCENT PARSING

For each nonterminal **<n>** of the EBNF specification, Parser.java has a corresponding static **parsing method n()**.

When **n()** is called, it expects **currentToken** to be a possible first token* of an instance of **<n>**. If this is so, then the call of **n()** will (if possible):

1. Read in the tokens in the rest of an instance of **<n>**.
2. Output (with an indentation of `TJ.output.treeDepth`) a sideways parse tree, with root **<n>**, that generates the instance of **<n>** that is read.

On return from a successful call of **n()**, **currentToken** will be the first token after the instance of **<n>** that it read.

*If **<n>** can generate an empty string, as in the case **<n> = <parameterDeclList>**, then when **n()** is called **currentToken** might also be the first token after an empty sequence that is derived from **<n>**.

The body of a parsing method **n()** has the form

```
{
  TJ.output.printSymbol(NTn);
  TJ.output.incTreeDepth();
  ...
  TJ.output.decTreeDepth();
}
```

where the code in **...** should be derived from the EBNF definition of the nonterminal **<n>**.

IMPORTANT: See [these slides](#) for an example of how to write such a parsing method!

How to Transfer `TJlasn/Parser.java` from `venus` or a PC to `euclid`'s `TJlasn` Directory

The following instructions assume that `xxxxx316` is your username on `euclid`.

If you are working on `venus`, and your current working directory is your home directory, enter the following command to transfer `TJlasn/Parser.java` to your `TJlasn` directory on `euclid`:

```
scp TJlasn/Parser.java xxxxx316@euclid.cs.qc.cuny.edu:TJlasn
```

You will be asked to enter your `euclid` password.

If you are working on a PC and your working directory is `c:\316java`, then you can transfer the file `TJlasn/Parser.java` into your `TJlasn` directory on `euclid` by entering the following command in a `cmd.exe` window:

```
scp TJlasn/Parser.java xxxxx316@euclid.cs.qc.cuny.edu:TJlasn
```

You will be asked to enter your `euclid` password.

IMPORTANT: After you have transferred `TJlasn/Parser.java` to your `TJlasn` directory on `euclid`, you should **test your code on euclid**—see the **How to Test Your Solution** instructions on the previous page. (It is not enough to have tested your code on `venus` or your PC, because testing on a machine other than `euclid` does not test the file you actually submitted!)

As stated on page 3 of the first-day announcements document, you are required to keep a backup copy of your submitted file on `venus`, and another copy elsewhere. You can enter the following two commands on `euclid` to email a copy of your submitted file to yourself and to put a copy of the file on `venus`:

```
echo . | mailx -s "copy of submission" -a TJlasn/Parser.java $USER
```

```
scp TJlasn/Parser.java your venus username@149.4.211.180:
```

The colon at the end of the second command is needed!

A Mistake to Avoid When Doing TinyJ Assignment 1

A common mistake in writing recursive descent parsing code is to write

```
getCurrentToken() == X
```

or `accept(X)` [which performs a `getCurrentToken() == X` test]

using a Symbols constant *X* that represents a nonterminal. This is wrong, as `getCurrentToken()` returns a Symbols constant that represents a token. Here are two examples of this kind of mistake.

1. When writing the method `argumentList()`, which should be based on the EBNF rule

```
<argumentList> ::= '(' [<expr3>{,<expr3>}] ')'
```

it would be wrong to write:

```
accept(LPAREN);
if (getCurrentToken() == NExpr3) /* INCORRECT! */ {
    expr3();
    ... // a while loop that deals with {,<expr3>}
}
accept(RPAREN);
```

Here it would be correct to write code of the following form:

```
accept(LPAREN);
if (getCurrentToken() != RPAREN) /* CORRECT */ {
    expr3();
    ... // a while loop that deals with {,<expr3>}
}
accept(RPAREN);
```

2. When writing the method `expr1()`, one case you need to deal with relates to the following part of the EBNF rule that defines `<expr1>`:

```
IDENTIFIER ( . nextInt '(' ')' | [<argumentList>] { '[' <expr3> ']' } )
```

Here it would be wrong to write something like:

```
case IDENT:
    nextToken();
    if (getCurrentToken() != DOT) {
        if (getCurrentToken() == NTargumentList /* INCORRECT! */ ) argumentList();
        ... // a while loop that deals with { '[' <expr3> ']' }
    }
    else {
        ... // code to deal with . nextInt '(' ')'
    }
    break;
```

Instead, you can write something like:

```
case IDENT:
    nextToken();
    if (getCurrentToken() != DOT) {
        if (getCurrentToken() == LPAREN /* CORRECT */ ) argumentList();
        ... // a while loop that deals with { '[' <expr3> ']' }
    }
    else {
        ... // code to deal with . nextInt '(' ')'
    }
    break;
```

The use of `LPAREN` in the above code is correct because the first token of any instance of `<argumentList>` must be a left parenthesis, as we see from the EBNF rule

```
<argumentList> ::= '(' [<expr3>{,<expr3>}] ')'
```

An Old Exam Question

A student is debugging his current version of Parser.java for TinyJ Assignment 1. He compiles his file and then runs his program as follows:

```
java -cp . TJlasn.TJ X.java X.out
```

He also runs the solution that was provided, as follows:

```
java -cp TJ1solclasses:. TJlasn.TJ X.java X.sol
```

The first difference between the output files X.out and X.sol is that X.sol has a comma on **line 567**, but this is missing in X.out. Lines 556 – 568 of X.sol and X.out are reproduced below with line numbers. (Lines 556 – 566 are the same in both output files.)

```
Lines 556 - 568 of X.sol [Output produced by java -cp TJ1solclasses:. TJlasn.TJ ...]:
556      <expr1>
557      IDENTIFIER: leq
558      <argumentList>
559      (
560      <expr3>
561      <expr2>
562      <expr1>
563      IDENTIFIER: size
564      ... node has no more children
565      ... node has no more children
566      ... node has no more children
567      ,
568      <expr3>
```

```
Lines 556 - 568 of X.out [Output produced by java -cp . TJlasn.TJ ...]:
556      <expr1>
557      IDENTIFIER: leq
558      <argumentList>
559      (
560      <expr3>
561      <expr2>
562      <expr1>
563      IDENTIFIER: size
564      ... node has no more children
565      ... node has no more children
566      ... node has no more children
567      <expr3>
568      <expr2>
```

Hint: In reading this output, recall that the indentation levels of consecutive lines are either the same or differ by just 1; thus line 567 has the same indentation as line 559.

Now answer the following two questions. In each case, *circle the correct choice*. [The answers are given on the next page.]

- (i) The output files show there is probably an error in the student's version of the method
(a) `expr1()` (b) `expr2()` (c) `expr3()` (d) `argumentList()` (e) `ifStmt()`
[1 pt.]
- (ii) Which one of the following changes might well fix this error?
(a) Insert a missing call of `accept (COMMA)` or `nextToken()` in the student's Parser.java.
(b) Delete a call of `accept (COMMA)` from the student's Parser.java.
(c) Delete a call of `nextToken()` from the student's Parser.java.
(d) Insert a missing call of `expr3()` in the student's Parser.java.
(e) Delete a call of `expr2()` from the student's Parser.java.
[1 pt.]

Debugging Hints for TinyJ Assignment 1

1. It is a very common mistake to omit a call of `accept(...)` or `nextToken()`: For *each* token in the EBNF definition of a non-terminal $\langle N \rangle$, the body of the corresponding parsing method $N()$ should contain a call of `accept(...)` or `nextToken()` whose execution may cause that token to be output as a parse tree node. Another common mistake is to call `nextToken()` when `accept(...)` should be called; this often produces the following error message:

Internal error in parser: Token discarded without being inspected

A third common mistake is to pass a `Symbols` object that represents a *non*-terminal as an argument to `accept(...)`, as in `accept(NTexpr7)`;—see [A Mistake to Avoid When Doing TinyJ Assignment 1](#) above.

2. The sideways parse tree in the output file can be regarded as an *execution trace* of your program, and can be useful when debugging your code! If your program is not working correctly, and you have produced both *k.sol* and *k.out* for some *k* (as described on page 4 of the assignment document), then the first line in *k.sol* that isn't in *k.out* shows "something my solution did that your program didn't do". (You can find that line from the output of `diff -c [on euclid/venus] or fc.exe /n [on a PC].`) When reading the output file for debugging purposes, bear the following in mind:
 - A. In a sideways parse tree, the parent of a node appears on the most recent previous line that has lower indentation. (Note that adjacent lines of the tree either have the same indentation or have indentation levels that differ by just 1.) For example, in the Old Exam Question, the parent of the comma on line 567 of *X.sol*, and of $\langle \text{expr3} \rangle$ on line 568, is $\langle \text{argumentList} \rangle$ on line 558.
 - B. Each non-terminal $\langle N \rangle$ in the output file is written when the corresponding parsing method $N()$ is called (by the call of `TJ.output.printSymbol(...)` at the beginning of N 's body). The value of `getCurrentToken()` at that time is shown by the first token in the output file *after* $\langle N \rangle$'s line. $\langle N \rangle$'s parent in the parse tree shows the caller of $N()$. For example, in the Old Exam Question, $\langle \text{expr3} \rangle$ on line 560 of *X.sol* was written when `expr3()` was called. The value of `getCurrentToken()` was `IDENT` at the time of the call (as shown by line 563); `expr3()` was called by the method corresponding to the parent of the $\langle \text{expr3} \rangle$ node on line 560—i.e., by `argumentList()`, as we see from line 558.
 - C. Each token in the output file is written during execution of a call of `accept(T)` or `nextToken()` in some non-terminal's parsing method, at a time when the value of `getCurrentToken()` is `T`; here `T` is the `Symbols` object that represents the token. The parsing method in question is shown by the token's parent in the parse tree. For example, in the Old Exam Question, the comma on line 567 of *X.sol* was written during execution of a call of `accept(COMMA)` or `nextToken()` in a non-terminal's parsing method; the value of `getCurrentToken()` was `COMMA` at the time of the call, and we see from line 558 that the parsing method in question was `argumentList()`.
 - D. The `... node has no more children` line that is a child of a node $\langle N \rangle$ of the tree is written *just before* the corresponding call of method $N()$ returns control to its caller. The value of `getCurrentToken()` at that time is shown by the first token in the output file *after* the line `... node has no more children`. For example, in the Old Exam Question, the line `... node has no more children` on line 565 of *X.sol* is a child of the node $\langle \text{expr2} \rangle$ on line 561, and was therefore written just before the corresponding call of `expr2()` returned control to its caller. The caller was `expr3()`, since the parent of $\langle \text{expr2} \rangle$ is the node $\langle \text{expr3} \rangle$ on line 560. Line 567 of *X.sol* shows that the value of `getCurrentToken()` was `COMMA` when `expr2()` returned control to `expr3()`.

The correct answers to the [Old Exam Question](#) are (i)—(d) and (ii)—(a). This follows from 2A, 2B, and 2C above.
