

# The TinyJ Virtual Machine's Memory (VM Registers are Not Shown)

**STATICALLY  
ALLOCATED  
DATA MEMORY**

**STACK-  
DYNAMICALLY  
ALLOCATED  
DATA MEMORY**

**HEAP-  
DYNAMICALLY  
ALLOCATED  
DATA MEMORY**

**CODE MEMORY**

**EXPRSTACK**

**An Example:** Which memory locations are statically allocated for the following TinyJ program? What variables / data are they allocated to / for?

```
import java.util.Scanner;

class Simple {
    static Scanner input
        = new Scanner(System.in);
    static int x, y = 10, z;
    public static void main(String args[])
    {
        System.out.print("Enter x: ");
        x = input.nextInt();
        f(17, y, x-y);
        System.out.println(y + f(21,22,23));
    }
    static int f (int a, int b, int c)
    {
        int v[], w, u = x;
        System.out.print("in f! ");
        return y - a % u;
    }
}
```

**Answer:** 18 locations are statically allocated as shown above.

address	Data Memory	allocated to / for:
0		x
1		y
2		z
3		'E'
4		'n'
5		't'
6		'e'
7		'r'
8		':'
9		'x'
10		':'
11		':'
12		'i'
13		'n'
14		':'
15		'f'
16		':'
17		':'

**An Example:** How many locations are allocated for each stackframe of the following function, and what stackframe offset is given to each formal parameter and each local variable declared in the body?

`int my_func(int x, int[] y, int z)`      **ANSWER: 11**

	offset	Stackframe of any call of my_func	allocated to
<code>int a, b[];</code>	-4		x
<code>if ( ... ) {</code>	-3		y
<code>int c, d[];</code>	-2		z
<code>...</code>	-1		return addr
<code>}</code>	0		dynamic link
<code>else {</code>	+1		a
<code>int e, f;</code>	+2		b
<code>...</code>	+3		c, e, h
<code>int g;</code>	+4		d, f, i
<code>...</code>	+5		g, j
<code>}</code>	+6		k
<code>...</code>			
<code>int h, i, j, k;</code>			
<code>...</code>			
<code>}</code>			

# Example of Stack-Dynamic Allocation

See p. 4 of: <https://euclid.cs.qc.cuny.edu/316/Memory-allocation-VM-instruction-set-and-hints-for-asn-2.pdf>

## Stack-Dynamically Allocated Data Memory

- (1) `main()` is called
- (2) `main()` calls `f()`
- (3) `f()` calls `g()`
- (4) `g()` calls `h()`
- (5) `h()` calls `f()`
- (6) `f()` returns control to `h()`
- (7) `h()` returns control to `g()`
- (8) `g()` calls `f()`
